Some 1- and 2-(aryl)substituted 4,5-bis (4-methoxyphenyl) imidazole compounds and 2-(aryl) substituted 4,5-bis (4-methoxyphenyl) imidazole compounds were obtained by reacting anisil with some aldehyde derivatives in the presence of ammonium acetate. 1-Ethyl-2-(aryl) substituted 4,5-bis (4-methoxyphenyl) imidazole compounds were obtained by reacting 2-(aryl) substituted 4,5-bis (4-methoxyphenyl) imidazole derivatives with ethyl iodide in tetrahydrofuran (THF) in the presence of NaH. The structure elucidation of the compounds were achieved by using spectral data and elemental analyses results.

Keywords: Imidazole; 2-(Aryl) substituted 4,5-bis (4-methoxyphenyl) imidazole; Anisil.

Introduction

Imidazole nucleus is found in a variety of compounds which possess various pharmacological effects such as, analgesic (1), antiinflammatory (2, 3), antifungal and antiprotozoal (4, 5), nematosid (6), tumor inhibitor (7, 8), sedative(9), hypolipidemic and hypocolesterolmic (10), gastric secretion inhibitor (11, 12), gastric acid neutralizer (13) and antiallergic (14) activities. Therefore, this findings prompted us to synthesize some new compounds which would be analgesic.

Materials and Methods

Melting points of the compounds were determined using Stuart Scientific Smpl melting point apparatus and were reported uncorrected. IR spectra were detected in KBr pellets using a Schimadzu-435 spectrophotometer. The 1H-NMR spectra were recorded in DMSO-d₄ by Jeol-JNM-EX90A and Bruker 250 MHz spectrophotometers using tetramethylsilane as internal standard. Elemental analyses were performed by Carlo Erba 1106 Analyzer. Mass spectra were recorded on VG PLATFORM.

* Correspondence
Anisil which was used as a starting material was synthesized with novel methods (15-17).

Methods

a. General method (18-19) for synthesis of 2-(aryl) substituted 4,5-bis (4-methoxyphenyl) imidazole derivatives: 0.01 mol anisil and 0.015 mol substituted aldehyde derivatives were reacted with 0.08 mol ammonium acetate in glacial acetic acid and refluxed for 5-7 hours. At the end of the reaction, the content of the reaction vessel was poured into ice-water and neutralized with ammonia solution. The precipitate was filtered and recrystallized from ethanol.

b. General method for synthesis of 1-ethyl-2-(aryl) substituted 4,5-bis (4-methoxyphenyl) imidazole derivatives: 0.01 mol of 2-(aryl) substituted 4,5-bis (4-methoxyphenyl) imidazole compounds were stirred with 0.015 mol NaH in THF and refluxed by the addition of ethyl iodide for 1.5-2.5 hours. The content of the reaction vessel was filtered, evaporated and the residue was washed with water, dried and recrystallized from ethanol. Some characteristics of all compounds are given in Table.

1b: IR [KBr, \( \nu_{max} \text{ cm}^{-1} \): 3020-3000 (Ar C-H), 2950-2900 (aliph C-H), 1620-1440 (C=N and C=C), 1295 (C-N), 1240, 1175 (C-O), 840 (1,4-disubstituted benzene), 770, 750 (monosubstituted benzene). \( \text{\textsuperscript{1}}H-NMR \) [250 MHz, \( \delta \), ppm, DMSO-d\textsubscript{6}]: 0.94 (3H, t, -CH\textsubscript{2}-CH\textsubscript{3}), 3.70 (3H, s, OCH\textsubscript{3}), 3.84 (3H, s, OCH\textsubscript{3}), 3.88 (2H, q, -CH\textsubscript{2}-CH\textsubscript{3}), 6.78 (2H,dj:14.63 Hz, aromatic ring), 7.10 (2H, d, j:14.29 Hz, aromatic ring), 7.29-7.39 (4H, m, aromatic ring), 7.46-7.56 (3H, m, aromatic ring), 7.71 (2H, d, j:9.48 Hz, aromatic ring).

5b: IR [KBr, \( \nu_{max} \text{ cm}^{-1} \): 3098-3025 (Ar C-H), 2983-2880 (aliph C-H), 1590-1450 (C=N and C=C), 1347 (C-N), 1263, 1185, 1076 (C-O), 885, 772 (1,2,4-trisubstituted benzene), 780 (1,4-disubstituted benzen). \( \text{\textsuperscript{1}}H-NMR \) [90 MHz, \( \delta \), ppm, DMSO-d\textsubscript{6}]: 0.95 (3H, t, -CH\textsubscript{2}-CH\textsubscript{3}), 2.67 (6H, s, CH\textsubscript{3}), 3.84 (6H, s, OCH\textsubscript{3}), 4.17 (2H, q, -CH\textsubscript{2}-CH\textsubscript{3}), 6.90-7.35 (11H, m, aromatic ring).

Results and Discussion

2-(Arly) substituted 4,5-bis (4-methoxyphenyl) imidazole compounds were obtained by the reaction of anisil with some aldehyde derivatives in the presence of ammonium acetate (18, 19). 1-Ethyl-2-(aryl) substituted 4,5-bis (p-methoxyphenyl) imidazole compounds
were obtained by the reaction of purified 2-(aryl) substituted 4,5-bis (p-methoxyphenyl) imidazole derivatives with ethyl iodide in NaH / THF (Scheme). 1-Ethyl derivatives could be synthesized also with NaOEt (1), with NaOH (23), with NaNH2 / THF (24) and other novel synthesis procedures (25-34) of 1-substitute imidazoles. At the syntheses which was performed with NaOEt, starting material and yield were observed together with ratio of 50-50 % on TLC plate. NaNH2 Was not preferred as a base since the NH3 so formed caused the reaction to be alkaline. At the study which was done with NaOH, not only product with a yield of 40 % was obtained, but also decomposition products were observed at the chromatographic studies. This method was abandoned because minor products could not be separated from the major product. But with a pair of NaH / THF used as a base-solvent system, a good seperation was obtained. And reaction time was shorter (1-2 hours). NaH / DMF was used for this purpose at the literature related to 1-ethyl imidazole derivatives (3). THF, a solvent with very low boiling point, was eliminated easily by evaporation from reaction medium. Due to these reasons NaH / DMF method was used for synthesis of 1-ethyl 2-(aryl) substituted 4,5-bis (p-methoxyphenyl) imidazoles.

*No effort was made to optimize yields All compounds were analyzed for C,H,N. The result had a maximum deviation of 0.4% from the theoretical value.
Although synthesis of 4b was carried with anisil and 3-OCH$_3$, 4-OH benzaldehyde (vanillin), 4-OC$_6$H$_5$ derivative instead of 4-OH derivative was obtained. After further purification by recrystallization, the structure of the compounds were elucidated and confirmed by using IR and $^1$H-NMR spectroscopic methods, elemental analyses for all compounds and MASS spectroscopy for selected compound (2b). General IR values of the compounds were: 3133-2998 cm$^{-1}$ (ar C-H), 1620-1420 cm$^{-1}$ (C=N and C=C), 1290-1020 cm$^{-1}$ (C-O) stretching and 885-750 cm$^{-1}$ (ar C-H) ring deformation bands were common for all compounds. N-H stretching band which was observed at the around of 3550-3359 cm$^{-1}$ due to starting material was no more observed for 1b-5b. At the $^1$H-NMR spectra of 1-ethyl imidazole derivatives, peaks around at 0.97 (3H, t, CH$_2$-CH$_3$), 3.79 (3H, s, OCH$_3$) (for 1b, 3b and 4b) or (6H, s, OCH$_3$) (for 4b and 5b) or (9H, s, OCH$_3$) (for 2b), 3.98 ppm (2H, q, CH$_2$-CH$_3$) were observed commonly. It is known that 1-ethylless imidazole derivatives would not demonstrate triplet around 0.97 ppm and quartet at 3.98 ppm. In the mass spectra of sample compound (2b), molecular ion peak and base peak were present at m/e 415.3 and 414.3, respectively. Analgesic activity study was planned as the continuation of this study.
